Truncating the y-axis is sometimes ok

- When you're trying to emphasize change, rather than relative magnitude.
- When you're plotting data over time.
- When zero is not a sensible baseline for comparison.

Bottom line: use your judgment; don't mislead people; watch out for “little y lies.”

How to do better

Good plots ...

- Make relevant comparisons and avoid irrelevant ones. Are truthful about magnitude.
- Minimize distractions.
- Introduce relevant conditioning variables.
- Stay firmly 2D (unless visualizing an actual 3D object, like a mountain or a building).
- Avoid meaningless variation (e.g. color differences that don't encode information).
- Have clear axis labels and informative titles/annotations.
- Highlight both overall trends and individual variation.
- Sometimes aren't plots at all – they're just tables.
- Are sensitive to the knowledge and limitations of the viewer.

WOMEN							

Start with what's simple and effective

Simple and effective plots:

- Density plots (histograms, boxplots, violin plots)
- Barplots: to show summary statistics (means/counts/proportions) by group
- Scatter plots: to show how two numerical variables are related
- Line graphs: to show how one numerical variable changes continuously versus another (e.g. time)

Simple and effective strategies for enriching these plots:

- Variation in size, shape, and/or color (but be colorblind-friendly and don't go crazy)
- Faceting: showing the same basic plot across multiple conditions
- Labels
